

ABSTRACT OF DISCLOSURE

Plural receiving recesses are radially formed at the periphery of the disc-like rotating body. The rotating body is rotatably installed at the base, and the cylindrical cover is provided at outside of the periphery of the rotating body. From the receiving region of the receiving recess for receiving the waterproof seal to downstream side of the rotational direction of the rotating body, the first brush and the second brush are attached with the cover and at the further downstream side, the detection device and the take-out device are mounted on the base in order.
